

Weierstrass approximation theorem.

(A very striking result)

Q: Suppose $f \in C[a, b]$ (we will consider $[a, b] = [0, 1]$: ~~lose~~ No loss of generality at all). Can we "approximate" f by a polynomial $p \in \mathbb{R}[x]$?

Classification/

Here "approximate" means uniform metric $(C[a, b], d_{\text{sup}})$:

i.e. "Given $\varepsilon > 0 \exists p \in \mathbb{R}[x]$ s.t.

$$\|f - p\|_{\infty} < \varepsilon$$

$$\text{i.e. } \sup_{x \in [0, 1]} |f(x) - p(x)| < \varepsilon.$$

\Leftrightarrow Given $f \in C[a, b]$
 $\exists \{p_n\} \subseteq \mathbb{R}[x] \rightarrow f$
 $p_n \xrightarrow{u} f!$

The answer is yes: By 1) Weierstrass (1885). & then also

2) Bernstein (1911) \leftarrow For us.

3) Fejér (1900) \leftarrow perhaps more effective: it comes from Fourier series point of view

4) Stone (1937): More powerful result: replaces $C[0, 1]$ by $C(X)$

Compact metric space.

Suppose (in addition), f is C^{∞} -fn (or C^k fn).

We can appeal to Taylor's polynomial (or even power series) approach. But it is fairly weak approximation.

Notably: i) Taylor approximation is (super) limited to

points near a given point, ii) for n -degree poly. approximation, we must know/play with bound of $(n+1)$ -th derivative, & finally what worse, $\exists f \in C^{\infty}(\mathbb{R})$ [namely: $f(x) = e^{-1/x^2}$ if $x \neq 0$ & $f(0) = 0$]

s.t. $f^{(n)}(0) = 0 \quad \forall n \geq 0, 1, \dots$

i.e: Taylor's (or power series) approach could be completely misleading !!

— okay —, So:

Thm: (Weierstrass approximation thm).

Let $f \in C[0, 1]$. Then $\exists \{p_n\} \subseteq \mathbb{R}[x] \rightarrow f$ (unif.). (\Leftrightarrow if $\varepsilon > 0$ then $\exists p \in \mathbb{R}[x]$ s.t. $\|f - p\| < \varepsilon$.)

Idea? Introduce "bump" p_n / polynomials !!

Okay: let's do it (through Bernstein).

Let $n \in \mathbb{N}^+$. We know

$$\sum_{k=0}^n \binom{n}{k} x^k (1-x)^{n-k} = 1$$

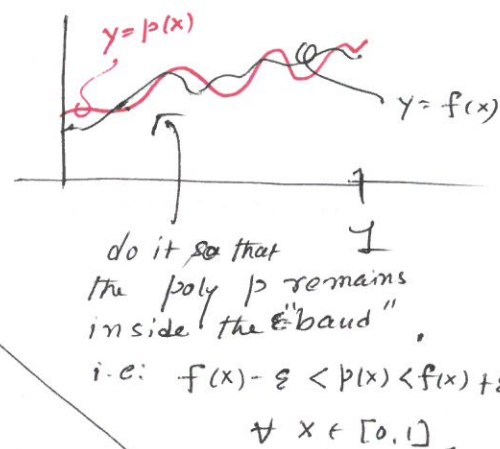

$:= b_k^n$

Def: $b_k^n(x) := \binom{n}{k} x^k (1-x)^{n-k}$, $0 \leq k \leq n$, $n \in \mathbb{N}$.
Called "Bernstein polynomial".

Binomial formula:

$$(a+b)^n = \sum_{k=0}^n \binom{n}{k} a^k b^{n-k}$$

$a \mapsto x$
 $b \mapsto 1-x$

Remark: 1) b_k^n yields the necessary "bump": See through mathematica or Wikipedia picture.

2) $\forall n \in \mathbb{N} \ \forall 0 \leq k \leq n$, b_k^n has a ! maxima at $x = \frac{k}{n}$.

[See the pic. again.]

We will use this.

3) $\sum_{k=0}^n b_k^n \equiv 1 \quad \forall n \in \mathbb{N}^+$

4) $\deg b_k^n = n \quad \forall 0 < k \leq n$

5) $b_k^n(x) \geq 0 \quad \forall x \in [0, 1]$

$$6) \quad b_k^n(1-x) = b_{n-k}^n(x) \quad \forall x \in [0,1]. \quad \text{easy}$$

$$7) \quad \int_0^1 b_k^n = \frac{1}{n+1}.$$

Anyway: (2) [along with many others] motivates us to define:

Def. Let $f: [0,1] \rightarrow \mathbb{R}$ be a fn. $\forall n \in \mathbb{N}$, define the Bernstein polynomial $B_n(f)$ as:

$$(B_n f)(x) = \sum_{k=0}^n f\left(\frac{k}{n}\right) b_k^n(x) \quad \left(= \sum_{k=0}^n f\left(\frac{k}{n}\right) \binom{n}{k} x^k (1-x)^{n-k} \right).$$

Remark:

$$1) \quad B_n: C[0,1] \longrightarrow \mathbb{R}[x].$$

$$f \longmapsto B_n f \quad \leftarrow \text{a poly. of degree at most } n.$$

$$2) \quad B_n \text{ is linear: } B_n(af + g) = a B_n f + B_n g \quad \forall a \in \mathbb{R}, f, g \in C[0,1].$$

$$3) \quad \text{Let } \underbrace{f \geq g}_{\text{i.e. } f(x) \geq g(x) \forall x} \text{ in } C[0,1]. \text{ Then } \underline{B_n(f) \geq B_n(g)}. \quad \leftarrow B_n \text{ is } \text{monotonic}$$

[Indeed, enough to prove: $B_n(f) \geq 0$ if $f(x) \geq 0 \forall x$.
Straightaway follows from (5) & $f\left(\frac{k}{n}\right) \geq 0$.]

$$4) \quad \underline{|B_n f| \leq B_n g} \quad \text{if } |f| \leq g. \quad \leftarrow \text{we need this.}$$

$$[|f| \leq g \Leftrightarrow -g \leq f \leq g. \text{ Next: apply (3)}]$$

$$5) \quad \underline{B_n 1 = 1} \quad [\text{by (3)}].$$

$$6) \quad \text{Let } f(x) = x \quad \forall x. \text{ Then } B_n f = f \quad (\text{i.e. } \underline{B_n x = x}).$$

$$\therefore B_n f = \sum_{k=0}^n \frac{k}{n} \binom{n}{k} x^k (1-x)^{n-k}.$$

$$= \frac{1}{n} x \sum_{k=0}^n k \binom{n}{k} x^k (1-x)^{n-k} = x$$

- Why? [Hint: Use $\frac{d}{da} (a+b)^n = n(a+b)^{n-1}$]

7) Use $\Rightarrow n(a+b)^{n-1} = \sum_{k=0}^n k \binom{n}{k} a^{k-1} b^{n-k}$
 again, diff., & get:

$B_n x^2 = x^2 + \frac{x-x^2}{n}$

VERY INTERESTING.

You can go on like this.

[We need $\{B_1, B_x, B_{x^2}\}$, & some basic properties (as remarked earlier).]

Proof of Weierstrass approx. thm.

Let $f \in C[0,1]$, $\varepsilon > 0$. $\therefore f$ is unif. cont. $\exists \delta > 0$ s.t.

$|f(x) - f(y)| < \varepsilon/2 \quad \forall \quad x, y \in [0,1], |x-y| < \delta.$

Set $M := \sup_{x \in [0,1]} |f(x)|$. Pick & fix $a \in [0,1]$.

Then $\forall x \in [0,1]$
 $|f(x) - f(a)| \leq \frac{\varepsilon}{2} + \frac{2M}{\delta^2} (x-a)^2$

Trivial.
 If $|x-a| < \delta$, then
 $|f(x) - f(a)| \leq \frac{\varepsilon}{2}$

Then $\forall x \in [0,1]$, $\therefore B_n$ is linear.

$| (B_n f)(x) - f(a) | = | B_n (f - \underbrace{f(a)}_{\text{constant } f_a}) (x) |$

If $|x-a| \geq \delta$, then
 $|f(x) - f(a)| \leq 2M \leq 2M \frac{(x-a)^2}{\delta^2}$
 Conclude $= \frac{2M}{\delta^2} (x-a)^2 \leq \frac{\varepsilon}{2} + \frac{2M}{\delta^2} (x-a)^2$

$\leq B_n \left(\frac{\varepsilon}{2} + \frac{2M}{\delta^2} (x-a)^2 \right)$

$= \frac{\varepsilon}{2} + \frac{2M}{\delta^2} B_n (x-a)^2$
 Linearity of B_n
 $= \frac{\varepsilon}{2} + \frac{2M}{\delta^2} B_n (x^2 - 2ax + a^2)$
 $= \frac{\varepsilon}{2} + \frac{2M}{\delta^2} \left(B_n(x^2) - 2a B_n(x) + B_n(a^2) \right)$
 $= \frac{\varepsilon}{2} + \frac{2M}{\delta^2} \left(x^2 + \frac{x-x^2}{n} - 2ax + a^2 \right)$
 $= \frac{\varepsilon}{2} + \frac{2M}{\delta^2} \left((x-a)^2 + \frac{x-x^2}{n} \right)$

$= \frac{\varepsilon}{2} + \frac{2M}{\delta^2} (x-a)^2 + \frac{2M}{\delta^2} \left(\frac{x-x^2}{n} \right) \quad \forall x \in [0,1].$

In particular.

$\xrightarrow{x=a} | (B_n f)(a) - f(a) | \leq \frac{\varepsilon}{2} + \frac{2M}{\delta^2} \left(\frac{a-a^2}{n} \right) \leq \frac{\varepsilon}{2} + \frac{M}{2\delta^2 n}$

[$\therefore \max\{a-a^2 : 0 \leq a \leq 1\} = \frac{1}{4}$]

$$\Rightarrow |(B_n f)(a) - f(a)| \leq \frac{\varepsilon}{2} + \frac{M}{2\delta^2 n} \quad \forall a \in [0, 1].$$

Choose
sup of LHS. $\Rightarrow \|B_n f - f\| \leq \frac{\varepsilon}{2} + \frac{M}{2\delta^2 n}.$

Choose $\underline{N} \geq \frac{M}{\delta^2 \varepsilon}.$ Then $\forall n \geq N,$
 $\Rightarrow \frac{M}{2\delta^2 N} < \frac{\varepsilon}{2}.$

$$\|B_n f - f\| \leq \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon. \quad \square$$

— x —
Thank you 😊
